

# RELIABILITY – 4WDs

## ▶▶ Make your Cooling System Run Cooler

### ▶ How?

Simply adding a bottle of Red Line's WaterWetter to your existing coolant in your radiator will improve your cooling system's ability to transfer heat - UP TO DOUBLE. WaterWetter can be added on top of any type of inhibitor, in any 4WD type, including those with huge HP or turbos or 4WDs with intercoolers.

### ▶ Why Use?

Ten minutes after you start your engine it develops 'hot spots' - little areas that can reach 500 degrees that aren't 'seen' on your temperature gauge. WaterWetter 'wets' hot metals where ordinary coolants can't. WaterWetter improves 4WD performance and efficiency especially under severe or hard conditions and does the job faster. WaterWetter reduces hot spots, cavitation corrosion, and helps eliminate detonation. It also prevents foaming, cleans & lubricates water pump seals and complexes with hard water to reduce scale.

### ▶ Maximum Protection?

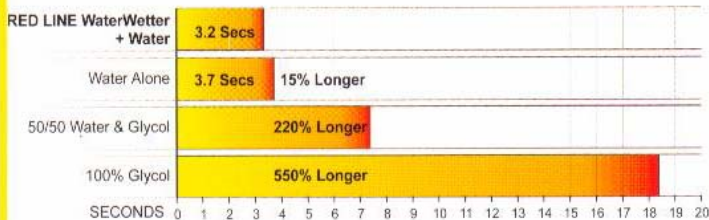

WaterWetter upgrades long term corrosion protection to 'world class'. WaterWetter is powerful and is designed to reduce rust and electrolysis in metals including aluminium, cast iron, copper, brass and bronze cooling systems. WaterWetter stops head distortion & cracking.

### ▶ What problems does WaterWetter solve?

Overheating in duress conditions - ie hot days, towing, heavily loaded vehicles, air-conditioners on full, inadequate sized radiators, performance or racing conditions, severe off-road, etc. Environment... Unlike other coolants, Red Line WaterWetter does not re-activate with rain to make roads slippery in the wet, which makes WaterWetter the 'safest'.

**...WaterWetter 'Wets' hot metals where other coolants can't...**

### COMPARED TIMES REQUIRED TO REDUCE THE TEMPERATURE OF ALUMINIUM

WaterWetter in a cooling system, clearly has better cooling efficiency than common coolants, most of which are classified as 'water & glycol'. Red Line WaterWetter gives best results all year round.
